Know Your Data – Dataset Understanding

1. Week 2 Contribution

Identified and studied numerical and categorical variables in the selected dataset.

2. Work Carried Out

During Week 2, my individual work focused on understanding the structure and characteristics of the Youth Smoking and Drug Consumption dataset. I examined the different columns and classified the available features into numerical and categorical variables. I also studied how these variables can be used for statistical analysis and visualization in the upcoming stages of the project.

3. Topics Studied

- **Numerical Variables – Identified continuous and discrete numerical features that represent measurable values and can be analysed using statistical methods.**
- **Categorical Variables – Studied categorical features that represent different groups or labels, such as gender and other category-based attributes.**
- **Continuous and Discrete Data – Understood the difference between continuous variables, which can take a range of values, and discrete variables, which represent countable values.**

- **Data Types – Examined different data types such as Integer, Float and Object to understand how the dataset stores information.**
- **Feature Classification – Studied how identifying numerical and categorical variables helps in selecting appropriate statistical methods and visualization techniques.**
- **Statistical Analysis Requirements – Explored which numerical features can be used for calculating Mean, Median, Mode and Standard Deviation, and which categorical features are suitable for frequency-based analysis.**

4. Outcome of My Contribution

This work helped me understand the structure of the selected dataset and the importance of classifying variables before performing statistical analysis. I gained knowledge of numerical and categorical data and understood how different variable types require different statistical techniques and visualizations.
